If you often wish that your breasts were larger, fuller or more shapely, breast augmentation surgery may be the right choice for you. Breast augmentation is a cosmetic procedure that uses implants to enlarge and shape the breasts. Your new look will bring you greater freedom with fashion and may give your self-image a boost as well.

You may be a good candidate for breast augmentation (augmentation mammoplasty) if you have any of the following conditions:

- You are bothered by the feeling that your breasts are too small

- Weight loss has changed the size and shape of your breasts

- After having children, your breasts have become smaller and have lost their firmness

- Dresses that fit well around your hips are often too large at the bustline

- One of your breasts is noticeably smaller than the other

- You feel self-conscious wearing a swimsuit or form-fitting top

How is breast augmentation performed?

The specific method chosen for your breast augmentation will be determined by your anatomy, Dr. Wigoda's preferences and your desired results. The incision is small and is usually made in one of three locations: underneath the breast just above the crease; around the lower edge of the areola; or within the armpit.

Once the incision is made, Dr. Wigoda creates a pocket into which the implanted is inserted. This pocket is made either directly behind the breast tissue or beneath the pectoral muscle located below the breast tissue and above the chest wall.

Anatomic tear drop shaped implants are available and may be optimal in certain patients, depending on their anatomy and the look they desire.
